Day - 27

Ai-generated Pandas Pipelines & Automation

SkillCourse
E-learning Platform by Satish Dhawale

A.I. Powered 30 Days Python Micro Course By Satish Dhawale (Microsoft Certified Trainer)

What is a Data Pipeline?

- A **data pipeline** is like a **factory assembly line**:
- Raw data → Clean → Transform → Analyze → Export
- Once built, the pipeline:
- Runs again and again
- Requires minimum human effort
- Saves time and avoids mistakes

Technical Explanation

- A Pandas pipeline is a **structured sequence of data processing steps**, usually automated using Python scripts, functions, or scheduled jobs.
- AI helps by:
- Designing the pipeline logic
- Generating Pandas code
- Suggesting optimizations
- Creating reusable workflows

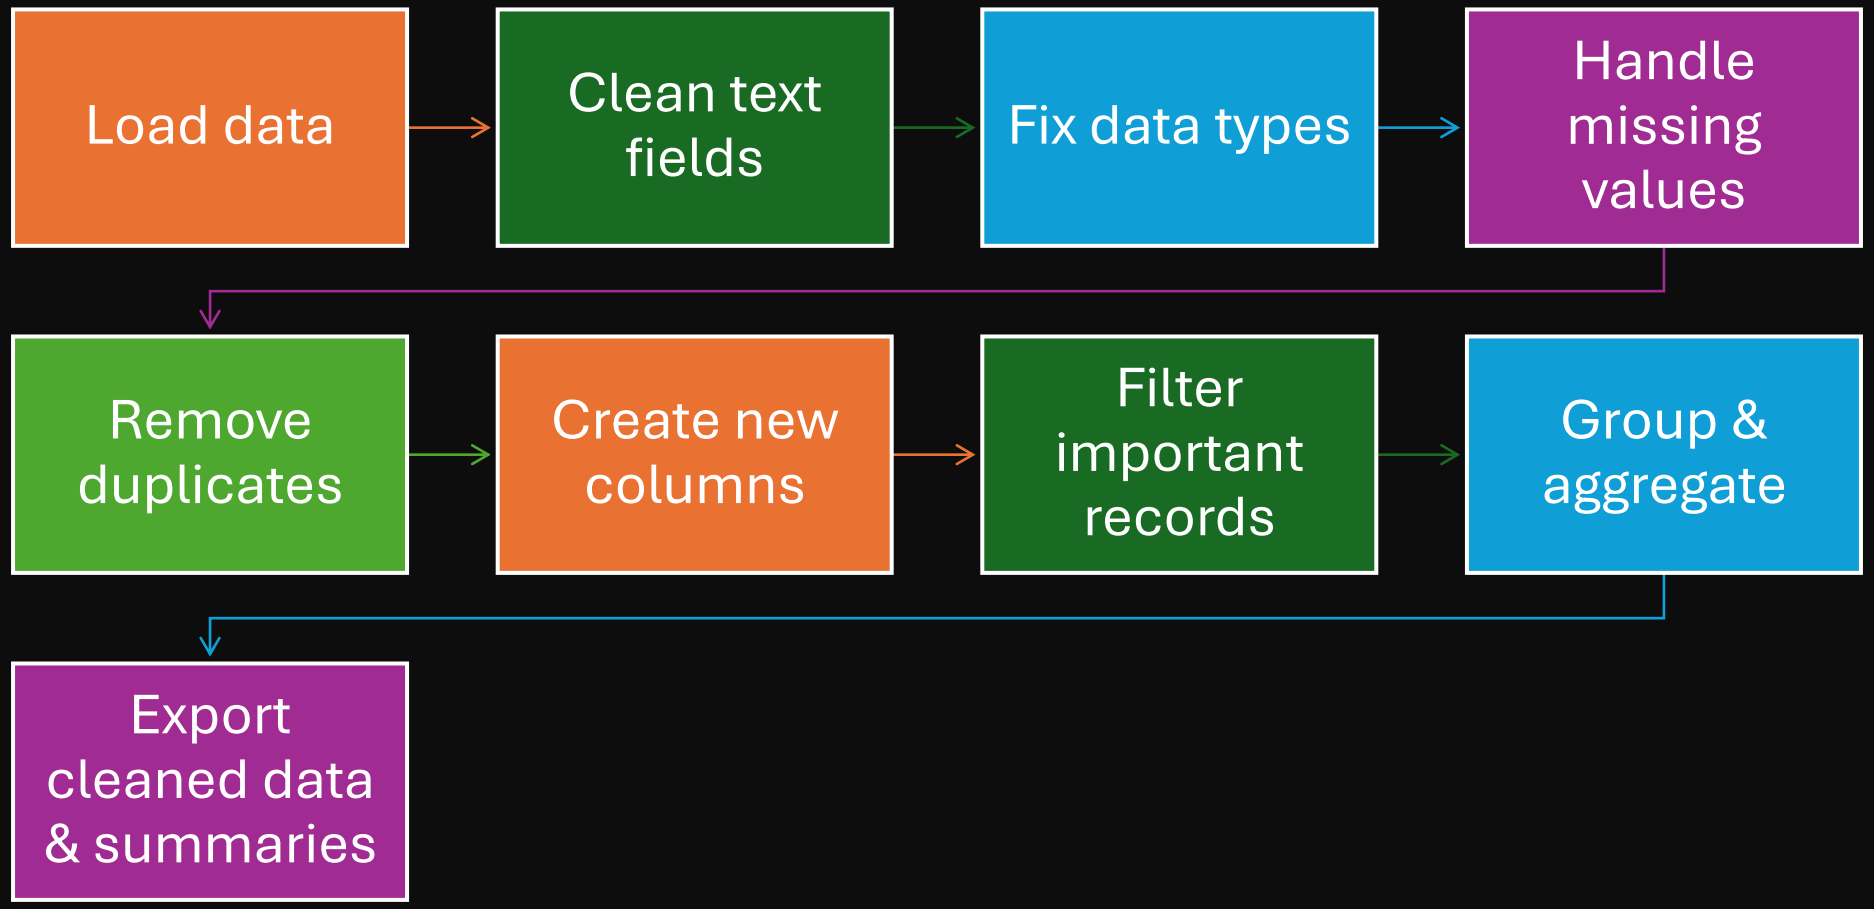
Why Automation Matters for Data Analysts

- Without automation:
  - Manual cleaning every day
  - Copy-paste code
  - High error probability
- With automation:
  - One-time setup
  - Repeatable execution
  - Scalable workflows
  - Production-ready analytics

Role of AI in Pandas Pipelines

- ✓ Generate full cleaning pipelines
- ✓ Convert requirements → code
- ✓ Suggest missing steps
- ✓ Refactor long scripts
- ✓ Create reusable functions
- ✓ Automate daily / weekly tasks

Typical Pandas Pipeline Stages



Prompt

I have a raw sales CSV file with columns like:

Order_ID,Order_Date,Customer_Name,City,State,Product_Category,Product_Name,Quantity,Unit_Price,Discount,Payment_Mode,Sales_Channel

Create a Pandas automation pipeline to:

1. Clean customer names, city and state values
2. Remove duplicate orders
3. Convert numeric columns properly
4. Calculate Total_Sales = (Quantity * Unit_Price) - Discount
5. Categorize orders as High / Medium / Low value
6. Create summary reports:
   - Total sales by City
   - Total sales by Product_Category
7. Sort summaries in descending order
8. Export cleaned data and summaries to CSV files
