Day - 9
Nested If & Multiple Conditions

SKILL COURSE

Nested If & Multiple Conditions

Nested If means putting an **if inside another if**.

Just like:

If it is Sunday:

> ***If it is not raining:*** **Go for a picnic**
> **Else: Stay home**

So, one condition depends on another condition.

Technical Definition:

A nested if statement is when an if block contains another if block inside it. Python checks conditions step-by-step.

Syntax of Nested If

```
if condition1:
   if condition2:
      statement
   else:
      statement
else:
   statement
```

Basic Example – Nested If

```
age = 20
id_card = True

if age >= 18:
    if id_card:
        print("You can enter.")
    else:
        print("ID card required.")
else:
    print("You are underage.")
```

Real Life Example

```
day = "Sunday"
weather = "Sunny"

if day == "Sunday":
    if weather == "Sunny":
        print("Go for a picnic")
    else:
        print("Stay home")
else:
    print("It’s a weekday")
```

Data Analyst Example – Customer Discount Eligibility

```
amount = 1200
is_member = True

if amount >= 1000:
    if is_member:
        print("Discount: 20%")
    else:
        print("Discount: 10%")
else:
    print("No discount")
```

Multiple Conditions

What Are Multiple Conditions?

- Multiple conditions mean checking **more than one thing at the same time** using:
  - and
  - or
  - Not

- Example:
  If the customer bought above 5000 **AND** is a premium member → give special offer.

Technical Definition

- Using logical operators (and, or, not) to combine two or more conditions in a single if.

Multiple Condition Example (and)

```
age = 25
has_license = True

if age >= 18 and has_license:
    print("You can drive.")
```

Multiple Condition Example (or)

```
city = "Mumbai"

if city == "Mumbai" or city == "Pune":
    print("Service Available")
```

Example using NOT

```
status = False
if not status:
    print("Status is False")
```

Data Analyst Example – Sales Category

```
sales = 90000
rating = 4.5

if sales >= 80000 and rating >= 4:
    print("High Performer")
elif sales >= 50000 and rating >= 3:
    print("Medium Performer")
else:
    print("Low Performer")
```
